

**Honors General Chemistry (Chem H2B) Winter 2022  
Second Midterm Exam**

**Instructions**

- Answer the questions below in the spaces provided. For full credit, results must be *inside* the answer boxes, rounded exactly to the requested precision, and in the correct units.
- If you need additional space for your work, use separate sheets of paper (provided to you during the exam), and submit them together with the exam. Do not write on the back of any sheet.
- This exam is administered in person and closed book. You may use a calculator, but no other electronic devices, notes, or books are allowed.
- This exam comprises 5 problems on 7 pages (excluding the cover).
- Please use only the molar masses provided in each problem and the exact values of the constants provided in the Appendix. Do not take atomic weights from the periodic table.
- Constants, unit conversions, and useful identities are provided in the appendix.
- Do not round intermediate results.
- Exam time is 50 minutes.

**By submitting this exam, you certify under the penalty of an academic integrity violation that all results are your own and were obtained according to the rules above. You consent to be forthcoming to any subsequent questions about your results and how exactly they were obtained, and understand that you may not receive credit if you cannot give a satisfactory answer.**

## Problems

### 1. Entropy (4 credits)

Does the entropy of the system/reaction mixture increase, decrease, or stay the same in the following processes? Briefly explain your answer in each case.

- a) Haber-Bosch synthesis of ammonia

Answer :

- b) Isomerization of neopentane (2,2-dimethylpropane) to *n*-pentane

Answer :

- c) Isothermal compression of an ideal gas

Answer :

- d) Mixing of two ideal gases at constant temperature, total pressure, and total volume

Answer :

**2. Essay Question: Gibbs Free Energy** (4 credits)

Explain in a few sentences why the Gibbs free energy is a central quantity in chemical thermodynamics. What type(s) of information can be obtained from the Gibbs free energy change of a process? Name at least two methods for determining the Gibbs free energy of a chemical reaction experimentally, computationally, or using tabulated data.

Answer :

**3. Equilibrium Constants** (4 credits)

Determine the equilibrium constant  $K_c$  at 25°C for the reaction

given the following data at 25°C:

Answer (2 significant figures):

#### 4. Van't Hoff Equation (5 credits)

In the gas phase, nitrosyl chloride NOCl is in chemical equilibrium with its dissociation products, nitrogen monoxide and chlorine gas.

	$\Delta H_f^\circ$ (kJ/mol)	$S^\circ$ (J/(mol K))
NO	90.29	210.76
ClNO	51.71	261.68
Cl <sub>2</sub>		223.08

Table 1: Thermochemical data at standard conditions.

- a) Formulate the balanced chemical equation including states.

Answer :

- b) Using the thermochemical data from Table , estimate the temperature  $T_c$  at which the equilibrium constant  $K$  equals 1.

Answer (3 significant figures):

- c) Qualitatively plot  $\ln K$  as a function of  $1/T$  based on your results from (b).

Answer :

**5. Statistical Thermodynamics (6 credits)**

2.5 mol of ethyne (a.k.a. acetylene,  $\text{C}_2\text{H}_2$ ) gas are kept in a 1 L steel cylinder. Assume ideal behavior.

- a) Determine the total enthalpy of the sample at 300 K.

Answer (3 significant figures):

- b) The pressure of the sample is doubled by reducing the volume to 0.5 L. The temperature is kept constant. Determine the total enthalpy.

Answer (3 significant figures):

- c) Estimate the rms velocity of the ethyne molecules in m/s at 300 K.

Answer (3 significant figures):

- d) Determine the entropy change when the original gas sample is heated from 300 K to 800 K.

Answer (3 significant figures):

- e) Ethyne has a standard free energy of formation of 209.9 kJ/mol. Why is it not smart to heat a pressurized steel cylinder containing ethyne?

Answer :

## Appendix A: Constants and Unit Conversions

Constant	Symbol	Value
Ideal gas constant	$R$	8.3145 J/(mol K)
Avogadro's constant	$N_A$	$6.022 \times 10^{23} \text{ mol}^{-1}$
Standard temperature (STP)	$T_s$	273.15 K
Standard pressure (STP)	$P_s$	101325 Pa = 1 atm
Molar volume of an ideal gas at STP	$v_s$	22.414 L/mol

Table 2: Physical constants

Quantity	Conversion
Volume	1 gal = 3.7854 L
Temperature	$\theta_C / ^\circ C = (\theta_F / F - 32) \times \frac{5}{9}$
Pressure	1 atm = 101325 Pa = 760 torr

Table 3: Unit conversions

## Appendix B: Identities

Equilibrium constants:

$$K_p = \left( \frac{1}{P^\circ} \right)^{\Delta\nu} K, \quad K_c = \left( \frac{P^\circ}{c^\circ RT} \right)^{\Delta\nu} K$$

Entropy change of an ideal gas at constant volume:

$$\Delta S = C_v \ln \frac{T_f}{T_i}$$

Van't Hoff Equation:

$$\ln K = -\frac{\Delta H^\circ}{RT} + \frac{\Delta S^\circ}{R}$$

## Appendix C: Periodic Table of the Elements

# Periodic Table of the Elements

**Do NOT use the atomic weights given here to answer exam questions!!**
