

Worksheet 7

February 15th, 2022

Collaborations are encouraged and students must report all collaborators on each assignment. All external sources (websites, books) must be cited. An *extra credit* (*EC*) problem will be available per assignment. Please submit a completed homework on-time to receive *EC* and no partial *EC* (all parts must be correct) will be given out. Additional problems are listed at the end of each assignment. This week's assignment is due *Tuesday, Feb 22nd at 10:00am*.

1. (4 pts) **Entropy** The following is a molecular visualization of a system undergoing a spontaneous change. Determine from the picture whether entropy increases or decreases during the process. Account for the spontaneity of the process in terms of the entropy changes in the system and the surroundings. The thermometers show the temperature of the system.

2. (2 pts) **Equilibrium and Law of Mass Action** Write the equilibrium constant expression for the following reaction:

At 100°C, the equilibrium constant is 0.1513. What is the equilibrium partial pressure of $\text{NH}_3(g)$ if the partial pressure of $\text{H}_2\text{S}(g)$ is 4.57 atm. Report to 3 significant figures.

3. (6 pts) **Relating Free Energy and Equilibrium Constant** Supposed a reaction is given by:

where a, b, ... are the coefficients and A, B, ..., C, D are the reactants and products.

(a) Derive the equation that relates the free energy of reaction (ΔG_r) and the equilibrium constant K as seen in lecture. Define all variables. *Hint:* $G(P) = G^\circ + nRT \ln \frac{P}{P^\circ}$.

(b) Using the equation in (a), at what temperature is the following reaction at equilibrium?

4. (4 pts) **Substituted Benzene** There are three different substituted benzene compounds with the formula $\text{C}_6\text{H}_4\text{F}_2$.

(a) Draw the lewis structures of the three compounds.

(b) Assume that the benzene rings pack similarly into their crystal lattices. If the positions of the H and F atoms are statistically disordered in the solid state, which isomer will have the *least* molar entropy?

5. (6 pts) **Air Pollutants** Sulfur trioxide SO_3 and nitrogen oxide NO can react in the atmosphere as follows:

(a) Predict the effect of the following changes to the amount of NO_2 when the reaction has come to equilibrium in a stainless steel bulb equipped with entrants for chemicals

1. the amount of NO increases
2. the SO_2 is removed by condensation
3. the pressure is tripled by pumping in helium

(b) Given that at a certain temperature $K = 6.0 \times 10^3$, calculate the amount (in moles) of NO that must be added to a 1.00 L vessel containing 0.245 mol $\text{SO}_3(\text{g})$ to form 0.240 mol $\text{SO}_2(\text{g})$ at equilibrium. Report to 3 significant figures.

6. (4 pts) In a sealed 1.75 L vessel at 250°C, equilibrium is established between $\text{PCl}_5(\text{g})$ and its dissociation products, $\text{PCl}_3(\text{g})$ and $\text{Cl}_2(\text{g})$. The quantities found at equilibrium are 0.562g PCl_5 , 1.950g PCl_3 , and 1.007g Cl_2 . What is the value of K_c and K_p for the reaction. Report to 4 significant figures.

7. (4 pts) *Extra Credit:* Determine K_c at 300K for the unbalanced equation

Report to 2 significant figures and given the following data

Optional Additional Problems: Ch. 15 - odd problems 21 - 49
